# Remaining ambiguity

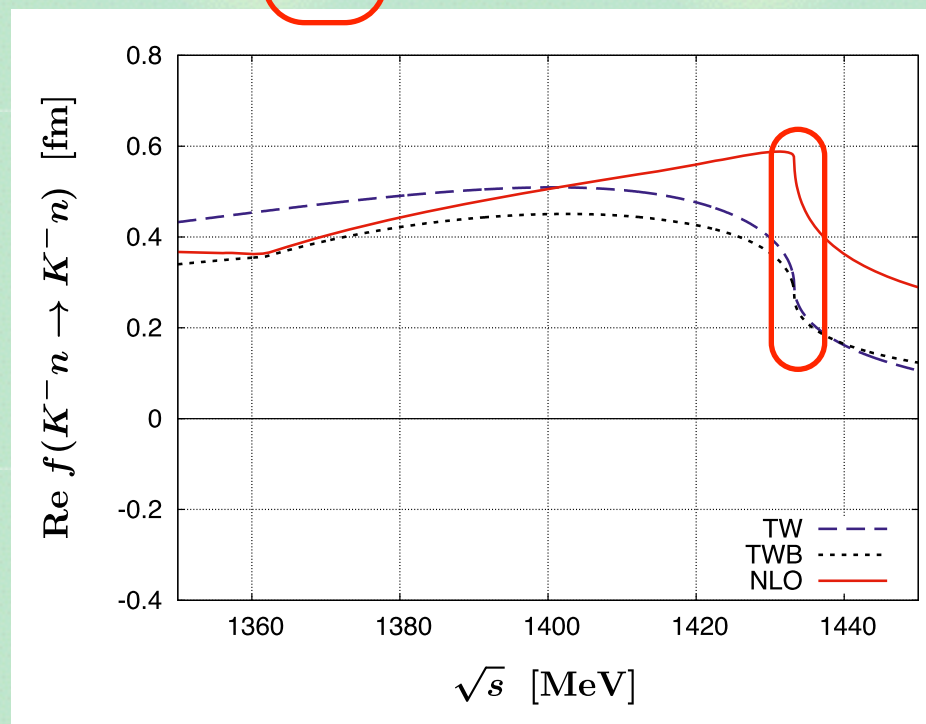

$\bar{K}N$  interaction has two isospin components ( $I=0, I=1$ ).

$$a(K^-p) = \frac{1}{2}a(I=0) + \frac{1}{2}a(I=1) + \dots, \quad a(K^-n) = a(I=1) + \dots$$

$$a(K^-n) = 0.29 + i0.76 \text{ fm (TW) ,}$$

$$a(K^-n) = 0.27 + i0.74 \text{ fm (TWB) ,}$$

$$a(K^-n) = 0.57 + i0.73 \text{ fm (NLO) .}$$

**$\Lambda(1405)$  is a  $\bar{K}N$  molecule.  $\leftarrow$  observable quantities**

# Summary: $\Lambda(1405)$

The  $\Lambda(1405)$  in  $\bar{K}N$  scattering is well understood by **NLO chiral coupled-channel approach** with accurate **K-p scattering length**.

Reliable reaction model will be important to analyze precise  **$\pi\Sigma$  mass spectra**.

Various analyses (lattice, realistic potential, compositeness relation) consistently indicate that the  $\Lambda(1405)$  is a  **$\bar{K}N$  molecule**.
