$\Lambda(1405)$ as a Feshbach resonance

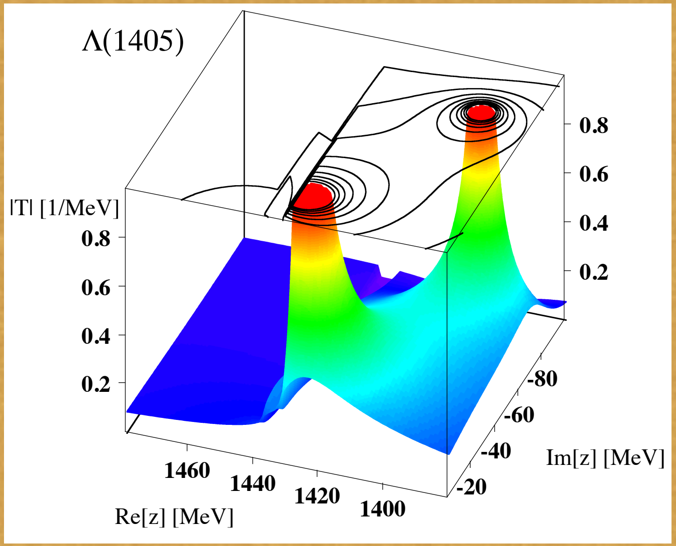
Tetsuo Hyodo

Yukawa Institute for Theoretical Physics, Kyoto Univ.

2018, Nov. 20th

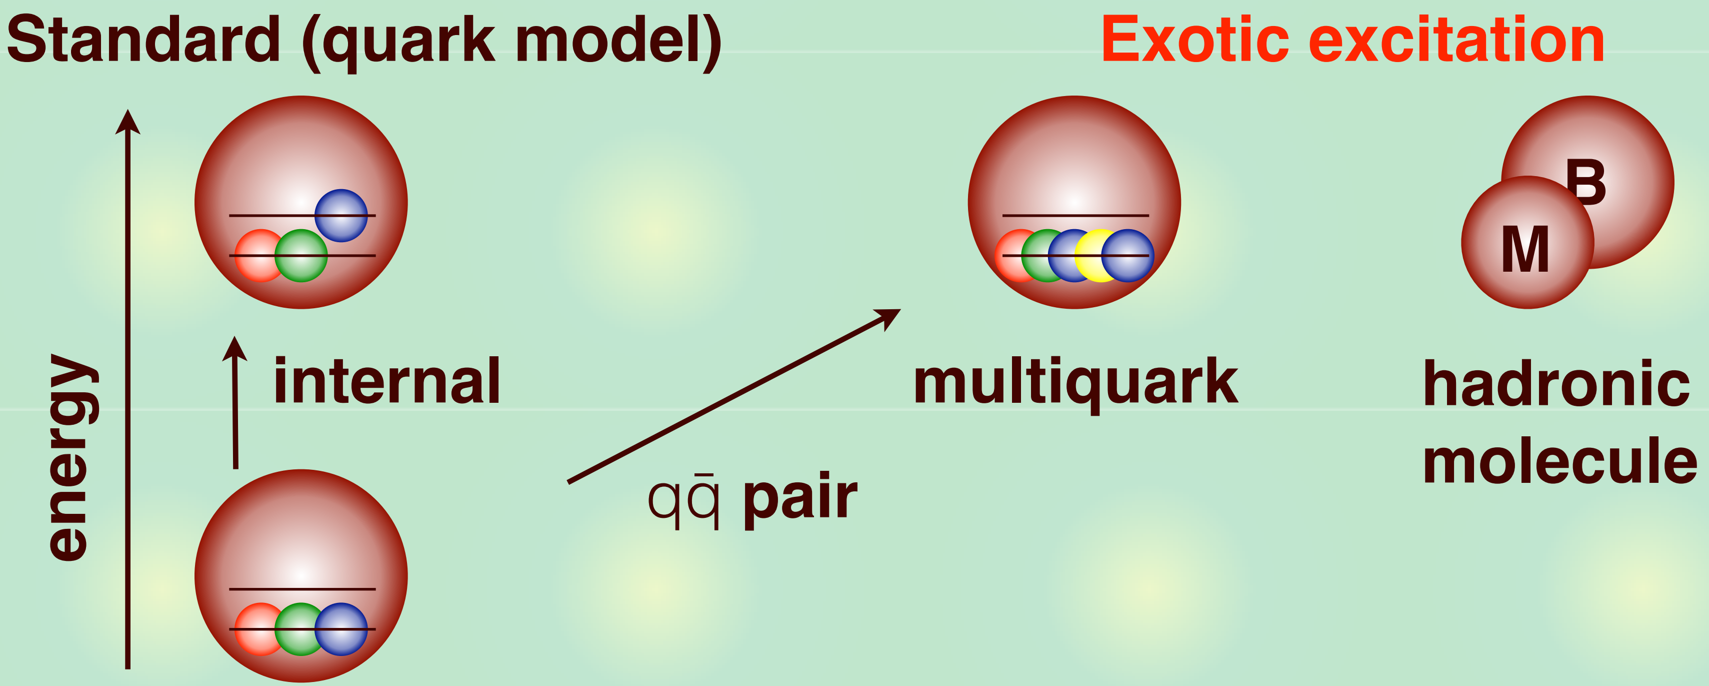
Contents

- Introduction
  - Clustering in hadron physics / resonances
- Current status of Λ(1405)
  - Analysis of $\bar{K}N$ scattering
- Two-pole structure
  - Interpretation
- Summary



Excitation of hadrons

Excitation mechanisms



Exotic structure : excitation inherent in QCD ($q\bar{q}$ pair creation), different from standard (shell-like) excitation

- **Verification? —> compositeness (poster by Kamiya)**
- **Are they stable particles?**

Unstable states via strong interaction

Many hadron states

PDG2018 : http://pdg.lbl.gov/

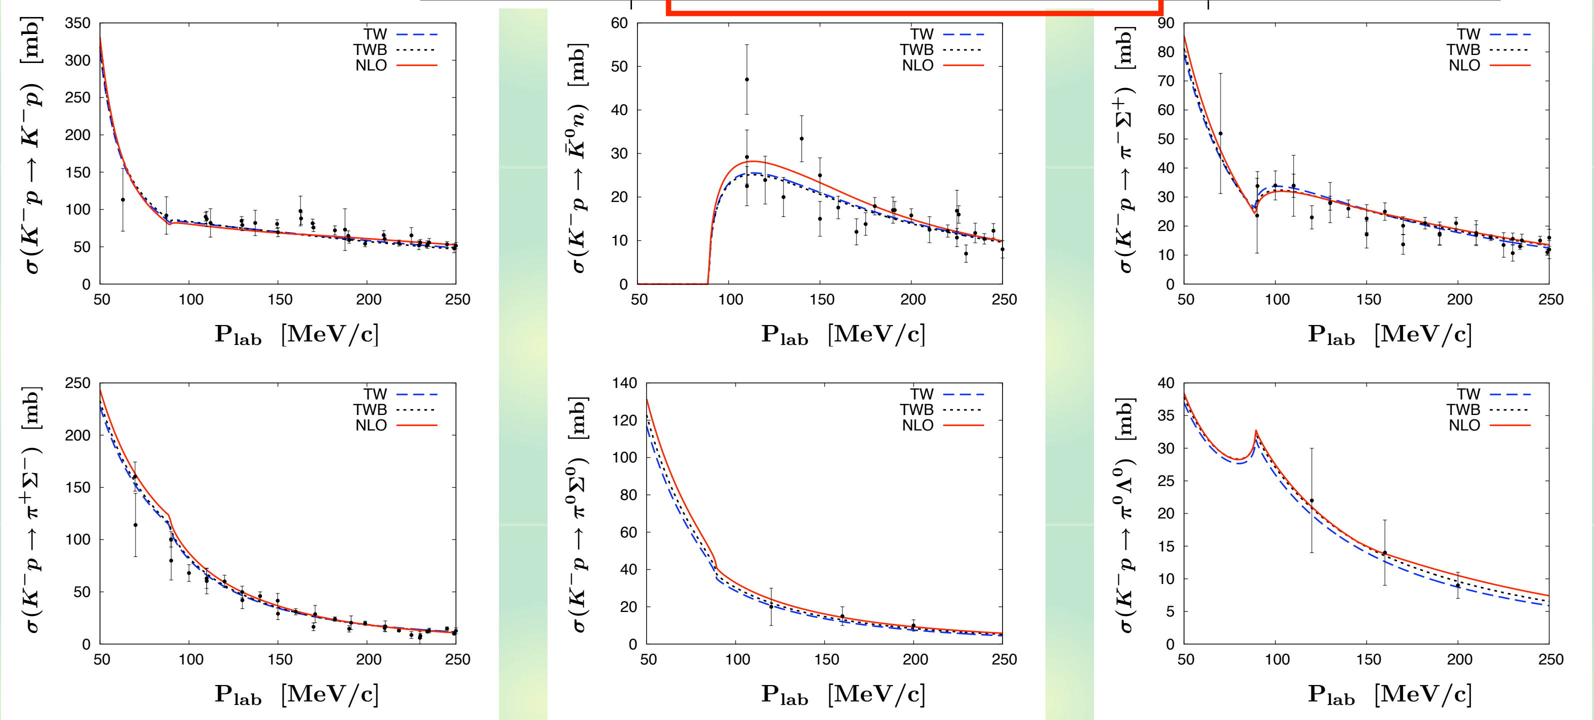
cross sections

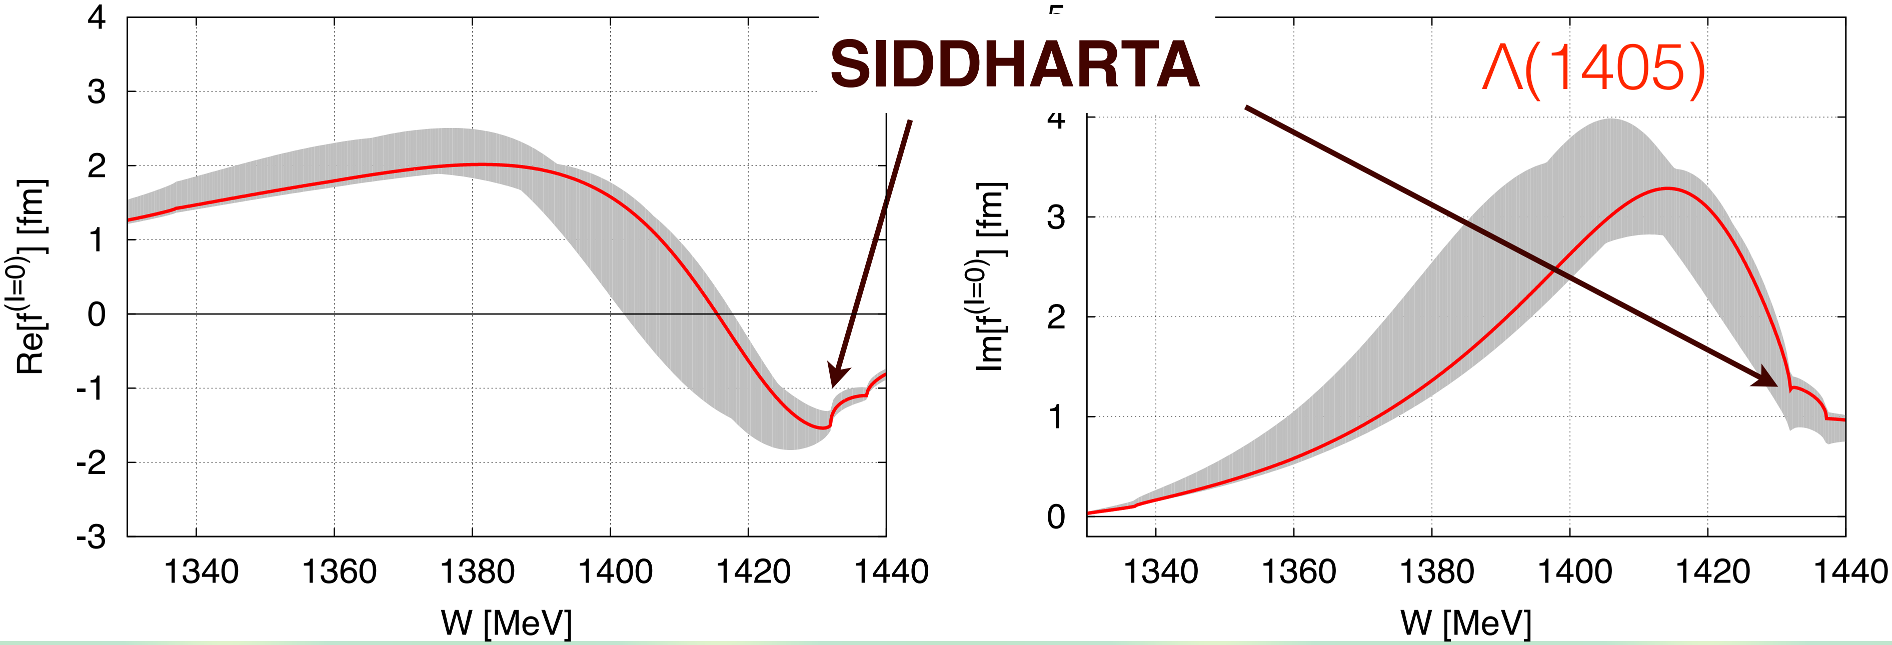


Y. Ikeda, T. Hyodo, W. Weise, PLB 706, 63 (2011); NPA 881 98 (2012)

Accurate description of all existing data (χ^2/d.o.f. ~ 1)

Subthreshold extrapolation

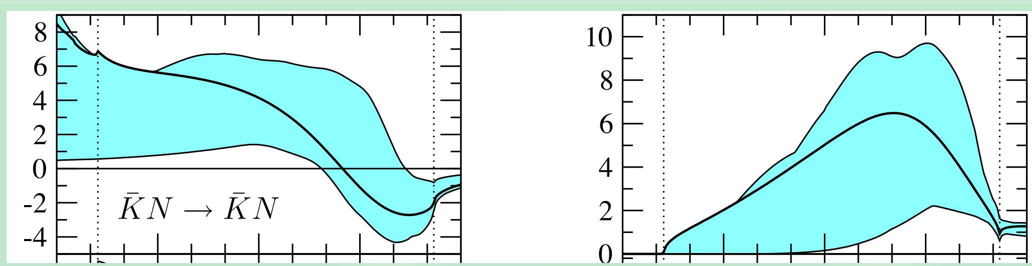
Uncertainty of $\bar{K}N \longrightarrow \bar{K}N$ (I=0) amplitude below threshold



Y. Kamiya, K. Miyahara, S. Ohnishi, Y. Ikeda, T. Hyodo, E. Oset, W. Weise, NPA 954, 41 (2016)

- c.f. without SIDDHARTA

R. Nissler, Doctoral Thesis (2007)



SIDDHARTA is essential for subthreshold extrapolation.

Update in PDG

$\Lambda(1405)$ in Particle Data Group (PDG)

M. Tanabashi, *et al.*, PRD 98, 030001 (2018), http://pdg.lbl.gov/

2014

$\Lambda(1405)\ 1/2^-$ $\quad I(J^P) = 0(\frac{1}{2}^-)$ Status

The nature of the $\Lambda(1405)$ has been a puzzle for decades: t... quark state or hybrid; two poles or one. We cannot here survey the rather extensive literature. See, for example, CIEPLY 10, KISSLINGER 11, SEKIHARA 11, and SHEVCHENKO 12A for discussions and earlier references.

... of the chiral-unitary community ... 400-MeV region. ZYCHOR 08 ... inst the two-pole model, but this ... REVAI 09, which finds little basis ... o-pole models; and IKEDA 12,

... 1405) fits nicely into a J^P = ... ner members are the $\Lambda_c(2595)^+$, ... Fig. 1 of our note on "Charmed

105. Pole Structure of the $\Lambda(1405)$ Region

Written November 2015 by Ulf-G. Meißner (Bonn Univ. / FZ Jülich) and Tetsuo Hyodo (YITP, Kyoto Univ.).

The $\Lambda(1405)$ resonance emerges in the meson-baryon scattering amplitude with the strangeness $S = -1$ and isospin $I = 0$. It is the archetype of what is called a dynamically generated resonance, as pioneered by Dalitz and Tuan [1]. The most powerful and

2018

$\Lambda(1405)\ 1/2^-$ $\quad I(J^P) = 0(\frac{1}{2}^-)$

In the 1998 Note on the $\Lambda(1405)$ in PDG 98, R.H. Dalitz discussed the S-shaped cusp behavior of the intensity at the N-$\overline{K}$ threshold observed in THOMAS 73 and HEMINGWAY 85. He commented that this behavior "is characteristic of S-wave coupling; the other below threshold hyperon, the $\Sigma(1385)$, has no such threshold distortion because its N-$\overline{K}$ coupling is P-wave. For $\Lambda(1405)$ this asymmetry is the sole direct evidence that $J^P = 1/2^-$."

A recent measurement by the CLAS collaboration, MORIYA 14, definitively established the long-assumed $J^P = 1/2^-$ spin-parity assignment of the $\Lambda(1405)$. The experiment produced the $\Lambda(1405)$ spin-polarized in the photoproduction process $\gamma p \to K^+\Lambda(1405)$ and measured the decay of the $\Lambda(1405)$ (polarized) $\to \Sigma^+$(polarized)π^-. The observed isotropic decay of $\Lambda(1405)$ is consistent with spin $J = 1/2$. The polarization transfer to the Σ^+(polarized) direction revealed negative parity, and thus established $J^P = 1/2^-$.

- Two-pole structure is confirmed.

Two-pole structure

Pole position = complex eigenvalue of Hamiltonian

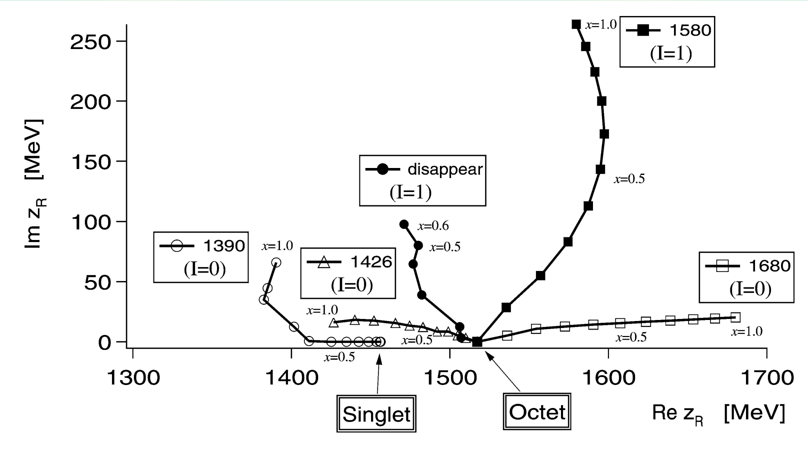
J.R. Taylor, *Scattering theory* (Wiley, New York, 1972);
T. Hyodo, Intensive lecture at Tohoku Univ. (2018)

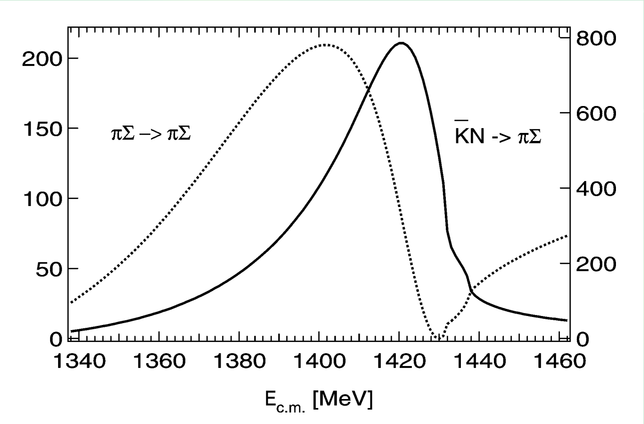
- two poles —> Λ(1405) is a superposition of two states

Origin in SU(3) basis and implication in spectrum

D. Jido, J.A. Oller, E. Oset, A. Ramos, U.G. Meissner, NPA 723, 205 (2003)

- attraction in 1 and 8 channels of SU(3) basis
- different channel coupling —> different πΣ spectum

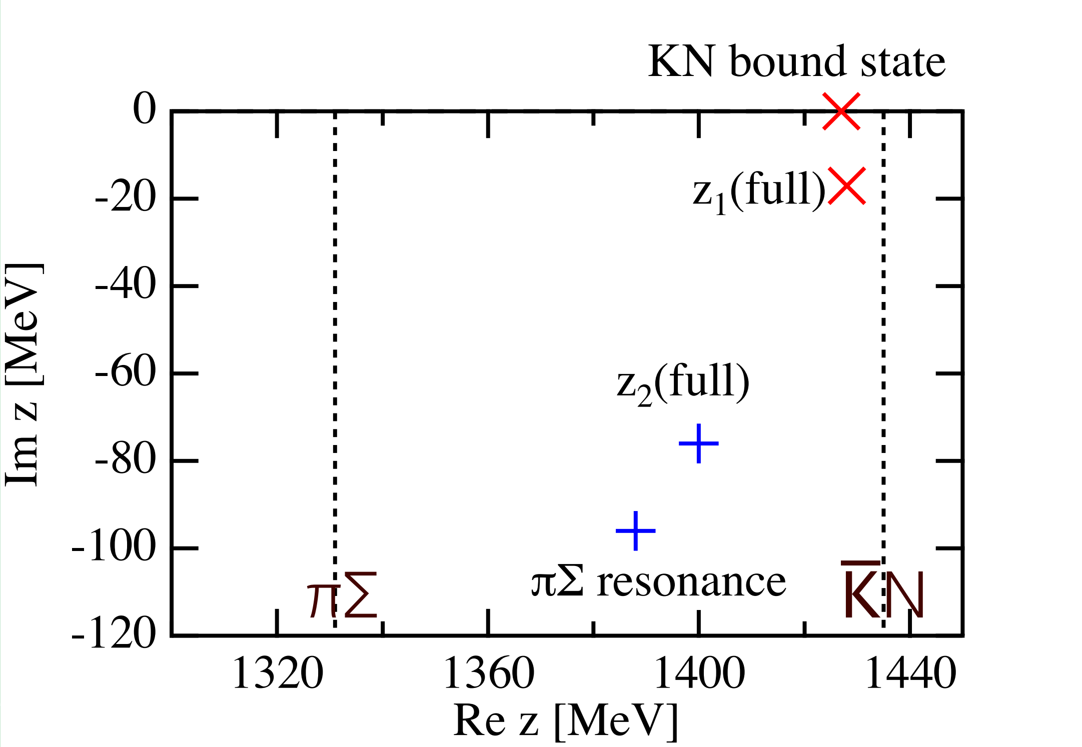


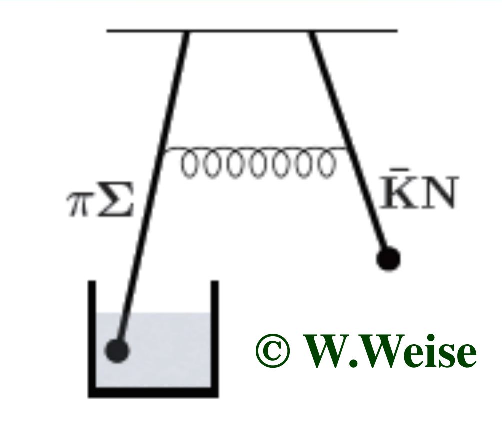


Origin in physical basis

Attraction exists both in $\bar{K}N$ and $\pi\Sigma$ channels

T. Hyodo, W. Weise, Phys. Rev. C 77, 035204 (2008)





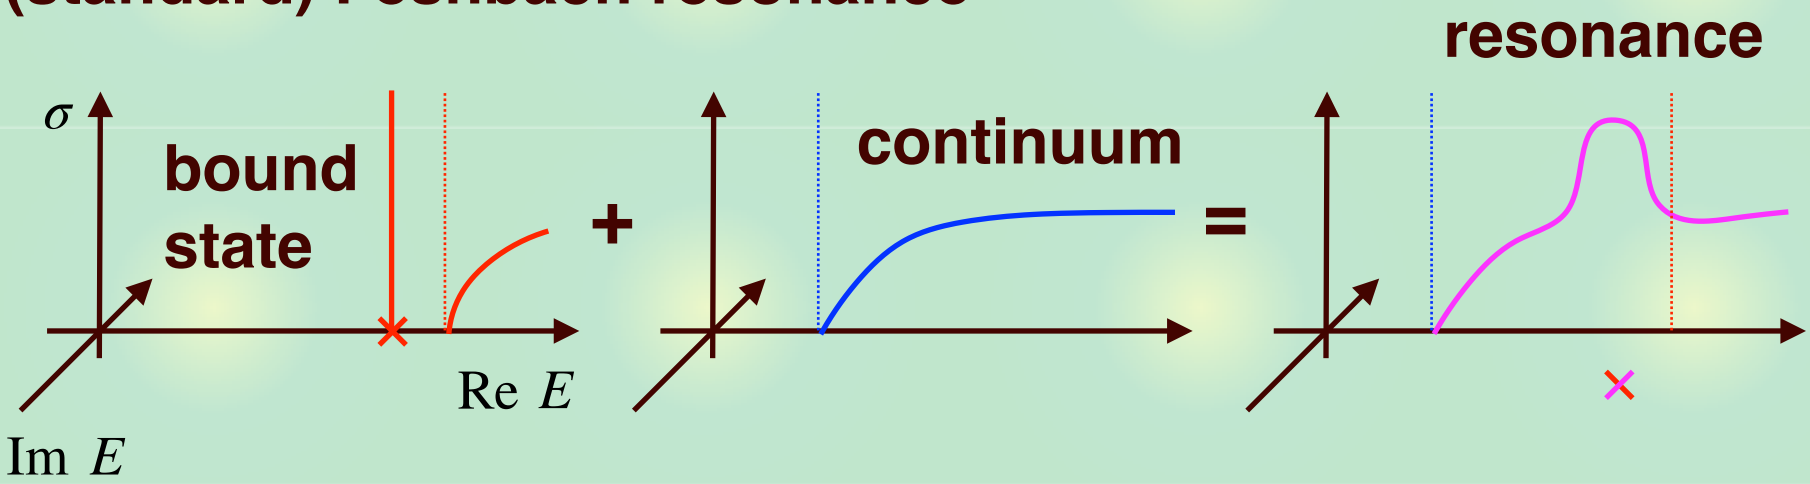
low-energy theorem

- **strong attraction in $\bar{K}N$: bound state**
- **attraction in $\pi\Sigma$: resonance**

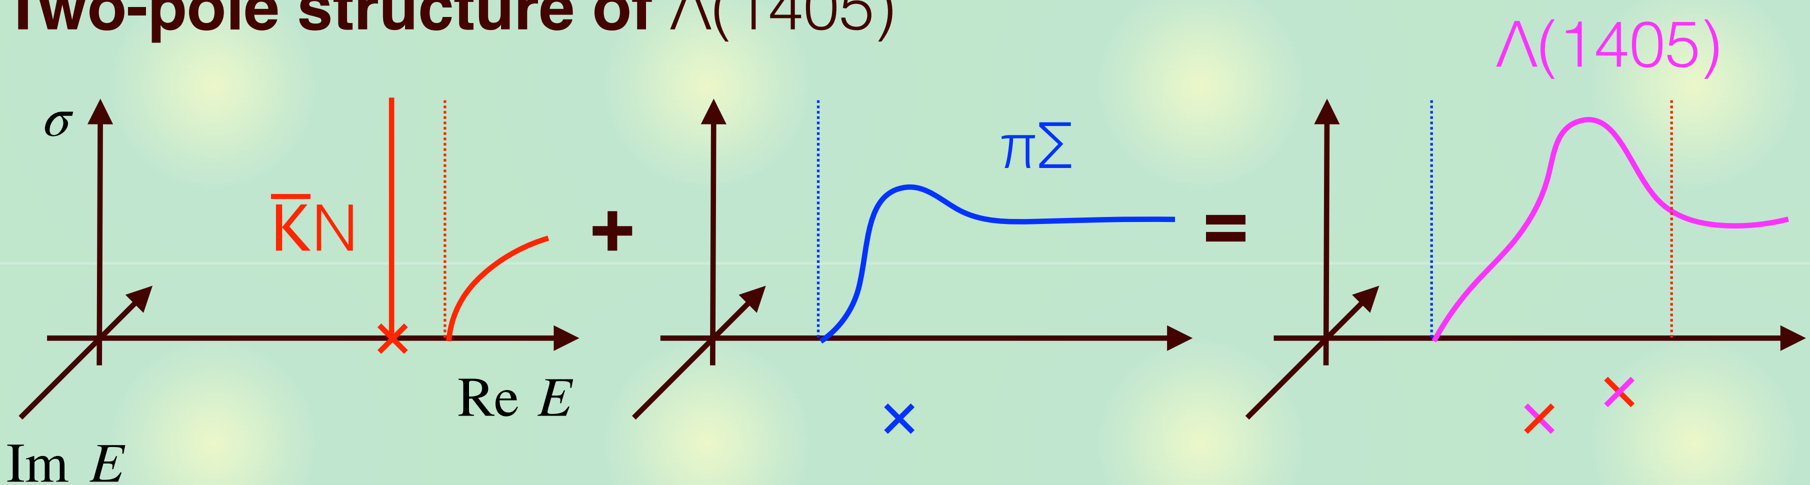
T. Hyodo, Intensive lecture at SNP school (2017)

Spectrum and pole

(standard) Feshbach resonance



Two-pole structure of Λ(1405)



—> Feshbach resonance in resonating continuum

Corresponding cold atom system?

^{6}Li atom : large background scattering length

I. Bloch, J. Dalibard, W. Zwerger, Rev. Mod. Phys. 80, 885 (2008)

- theoretical study on large a_{bg}

B. Marcelis, *et al.*, Phys. Rev. A 70, 012701 (2004)

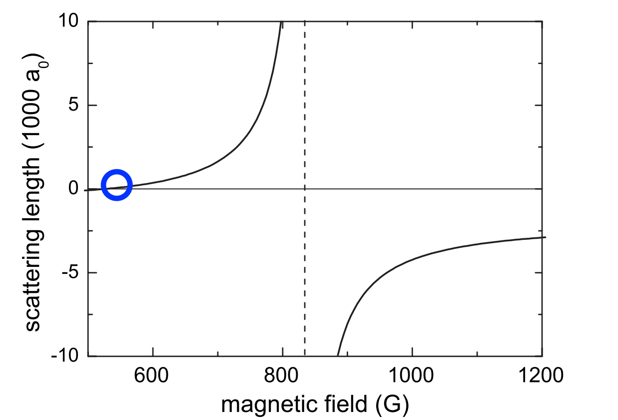


FIG. 2. Magnetic field dependence of the scattering length between the two lowest magnetic substates of ^{6}Li with a Feshbach resonance at B_0=834 G and a zero crossing at $B_0+\Delta B$ =534 G. The background scattering length $a_{bg}=-1405a_B$ is exceptionally large in this case (a_B the Bohr radius).

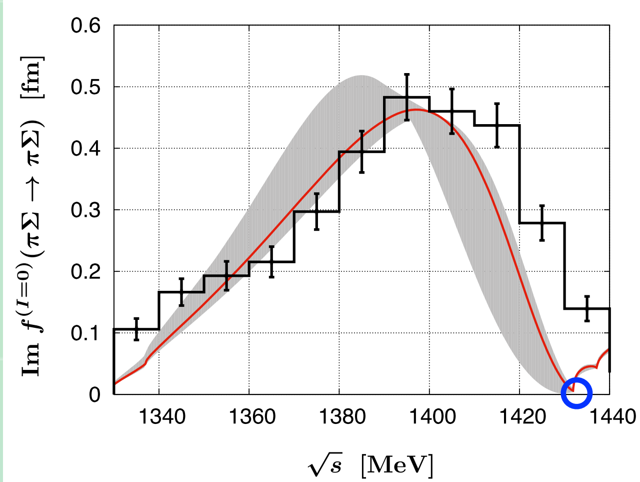
1405 !

- vanishing of scattering length near the unitary limit



CDD zero near pole —> non-composite nature
